

Night storage heaters

A simple guide

Storage-heaters all work by storing heat generated by cheap night-time electricity and releasing this heat during the day

Most storage heaters are wall-mounted and look a bit like radiators. They work by drawing electricity over the course of a few hours at night, and storing it as heat in a 'bank' of clay or ceramic bricks to use the following day. The advantage is that they can consume electricity at night, when it's cheap, and give out their heat many hours later.

As a consequence they work best if the household is on **Economy 7**. This is a tariff in which night-time electricity is much cheaper – typically about a third of the price – but day-time electricity is more expensive. The cheap hours are normally from midnight until 07.00 in winter, and from 01.00 to 08.00 in summer, although this can vary. For more information about Economy 7, see our other leaflet.

Jack & Gwen's storage heater

Jack and Gwen are a retired couple whose home is heated with electricity. They have **storage heaters** to take advantage of the Economy 7 tariff.

In winter, they are in for most of the day. This means they want the storage heater to charge fully at night, so they set the **input** to **6** and the **output** to **1** or **off**.

In the morning, to warm the house up, they turn the **output** to **4**. Once the house is warm, they turn it down to **2**, and in the evening when it becomes chillier, they turn it up to **5** or **6** to use up the remaining stored heat.

All storage heaters have a pair of controls for input and output

Night storage heaters can be a good option where electricity is used to heat the home.

Every storage heater has a set of simple controls. An **input** setting allows you to regulate the amount of heat that the heater stores during the night. This is important because, even though night-rate electricity is cheap, there's no point paying for more than you need. If it's not particularly cold, or you'll be out of the house for most of the day, you don't need to set the input to maximum because there's no point storing so much heat. Most storage heaters will **only** charge up at night, so there is no danger of using expensive day-rate electricity.

The controls also have an **output** setting that allows you to regulate the amount of heat that the storage heater gives off. It means you don't have to use up all the stored heat at once, but can let it out gradually, saving some for the evening if you want to.

Some storage heaters have a timer that gives you even more control over the output. It allows you, for example, to programme your heater to come on at a time that suits you, for example when you get up in the morning or just before you get back from work. Others include a control that regulates the amount of charge the heater draws at night, depending on the temperature.

Some storage heaters have a 'boost' setting. This doesn't use 'cheap-rate' stored heat, but uses 'peak-rate' electricity directly from the mains, so it should only be used if the stored heat has run out.

Getting the best from your storage heater

The 'output' setting of your storage heater should be turned off at night; and also turned off when you are out of the room or out of the house.

The 'output' setting should be turned off at night

The **boost** setting can be used to throw out extra warmth. But it uses up stored heat more quickly, so avoid using it unless you really have to.

Avoid using supplementary plug-in heaters. It's better to turn up the input on your storage heater and store more heat.

... and a few other ways to cut your electricity use, and save money

Give your clothes a day in the sun; and give your tumble drier a break. Clothes dried in the fresh air feel great, and there are drying days in winter, too.

Don't leave your phone on charge all night. It only needs an hour or so. And try not to leave the TV and other kit on stand-by.

Catch 'em young!

Encourage your children to switch off electric toys and lights that they're not using. They'll soon get the hang of saving energy.

Dodge the draught!

Fit draught-excluders to your front door, letter box and key hole, and draw your curtains at dusk to keep the heat in.

Only fill the kettle with as much water as you actually need (but make sure you cover the metal element).

Buying a new appliance? Look out for the Energy Saving Trust 'recommended' logo.

Wait until you have a full load in your dishwasher or washing machine before using.

Sleep tight. Make sure all the lights are turned off when you go to bed. You can get low-wattage night lights for children's rooms or landings.

More energy-saving advice at www.cse.org.uk/advice

Warm & Safe Wiltshire helps people in Wiltshire live in warmer, safer and healthier homes.

Our help line is open 9-5pm Monday-Friday and offers advice on:

- Insulation & draught proofing
- Heating systems & controls
- Damp and condensation
- Understanding your fuel bills
- Switching energy suppliers
- Fuel debt
- Grants & schemes
- Fire safety

We also offer free home visits to eligible residents.
